OSIM Lab

Phase 3 — Blue Stack Expansion Report | 2026-04-03

Document	OSIM-RPT-004	Status	COMPLETE	Version	1.0
Author	Alec Sanchez	Phase	3 — Blue Stack	Repo	github.com/osim-framework/osim-core

1. Executive Summary

Phase 3 Blue Stack Expansion is complete. All detection and response tools are deployed, configured, and operational. The OSIM Lab now has a full production-grade SOC detection stack with Wazuh SIEM, TheHive case management, MISP threat intelligence, Greenbone vulnerability scanning, and Velociraptor live response — all integrated and accessible from the management MacBook. All three Windows domain hosts have Velociraptor agents connected. The lab is ready for the first ATT&CK; simulation exercise.

2. Full VM Inventory — P520 Blue Node

VMID	Name	OS	RAM	IP	VLAN	Role	Status
100	**wazuh-manager**	Ubuntu 22.04	16GB	10.10.40.10	40	Wazuh SIEM + Indexer + Dashboard	**Active ✓**
101	**thehive**	Ubuntu 22.04	4GB	10.10.20.10	20	TheHive 5.4 case management	**Active ✓**
102	**misp**	Ubuntu 22.04	4GB	10.10.20.11	20	MISP 2.4 threat intelligence	**Active ✓**
103	**greenbone**	Ubuntu 22.04	4GB	10.10.40.20	40	Greenbone CE v26.21.0 vuln scanner	**Active ✓**
104	**velociraptor**	Ubuntu 22.04	4GB	10.10.40.30	40	Velociraptor v0.76.1 live response	**Active ✓**
106	**win-dc01**	WS 2022	6GB	10.10.30.10	30	AD DC — osim.lab domain	**Active ✓**
107	**win-client01**	Windows 11	4GB	10.10.30.20	30	Domain workstation	**Active ✓**
108	**win-client02**	Windows 10	4GB	10.10.30.21	30	Domain workstation	**Active ✓**

3. Detection Stack — Full Status

Tool	Version	URL	Agents/Clients	Status
Wazuh SIEM	4.11.2	https://10.10.40.10	4 agents: OPNsense, DC01, CLIENT01, CLIENT02	**Active ✓**
TheHive	5.4	http://10.10.20.10:9000	MISP integration active	**Active ✓**

MISP	2.4	https://10.10.20.11	TheHive integration active	**Active ✓**
Greenbone	26.21.0	https://10.10.40.20:9392	No scans run yet	**Active ✓**
Velociraptor	0.76.1	https://10.10.40.30:8889	3 clients: DC01, CLIENT01, CLIENT02	**Active ✓**
Sysmon	v15.90	All Windows hosts	Olaf Hartong modular config	**Active ✓**
Caldera	—	—	Not yet deployed	**Pending**

4. Velociraptor Installation Notes

Velociraptor v0.76.1 was installed as a systemd service on VM 104 (Ubuntu 22.04, 10.10.40.30). Windows MSI agents were repacked with the server config pointing to https://10.10.40.30:8000. Key issue encountered: initial server config generated with localhost instead of 10.10.40.30 — fixed by editing server.config.yaml and regenerating the client config. Windows agents required manual config replacement via HTTP server on the Velociraptor VM after MSI repack embedded incorrect URL.

Component	Detail
Binary	`/usr/local/bin/velociraptor`
Server config	`/etc/velociraptor/server.config.yaml`
Datastore	`/opt/velociraptor/`
Frontend port	8000 — client connections
GUI port	8889 — admin dashboard (https://10.10.40.30:8889)
Admin user	admin / OsimSecure2026!
Windows clients	DC01 (10.10.30.10), CLIENT01 (10.10.30.20), CLIENT02 (10.10.30.21)
Firewall rule	WIN-VELOCIRAPTOR-AGENT: WINDOWSENT → 10.10.40.30:8000 PASS

5. Greenbone Installation Notes

Greenbone Community Edition v26.21.0 deployed via Docker Compose on VM 103. Key issue: openvas-scanner:stable tag had a broken layer (6be8b3baf026) on the Greenbone registry. Fixed by pinning to v23.41.3. nginx configured to listen on 0.0.0.0:9392 instead of 127.0.0.1 for remote access. All 16 containers healthy.

Component	Detail
Version	Greenbone Vulnerability Manager 26.21.0 (DB revision 273)
Access URL	https://10.10.40.20:9392
Admin user	admin / OsimSecure2026!

Containers	16 containers running — nginx, gvmd, gsad, gsa, pg-gvm, ospd-openvas, openvas, openvasd, redis, vulnerability-tests, scap-data, notus-data, cert-bund-data, dfn-cert-data, report-formats, data-objects
Scanner version	OpenVAS v23.41.3 (pinned due to broken stable tag)
Compose file	`~/greenbone-community-container/compose.yaml`
Firewall rule	MB-GREENBONE-WEB: MGMTB → SECURITY:9392 PASS

6. Snapshots Taken This Phase

VMID	VM	Snapshot	Description
103	**greenbone**	**greenbone-docker-running**	Greenbone CE v26.21.0, 16 containers running, port 9392 accessible
104	**velociraptor**	**velociraptor-vm-baseline**	Ubuntu 22.04 baseline, SSH working, before Velociraptor install
104	**velociraptor**	**velociraptor-server-running**	Velociraptor v0.76.1 server running, GUI on 8889, frontend on 8000
104	**velociraptor**	**velociraptor-agents-connected**	All 3 Windows agents connected: DC01, CLIENT01, CLIENT02
106	**win-dc01**	**dc01-velociraptor-agent**	DC01 Velociraptor agent connected to 10.10.40.30:8000
107	**win-client01**	**win11-velociraptor-agent**	CLIENT01 Win11 Velociraptor agent connected
108	**win-client02**	**win10-velociraptor-agent**	CLIENT02 Win10 Velociraptor agent connected

7. Immediate Next Steps

Priority	Task	Description
1 — HIGH	**Deploy Caldera**	Create VM 105, deploy Caldera adversary simulation on VLAN 40 (10.10.40.40)
2 — HIGH	**First ATT&CK; simulation**	Run T1059.001 PowerShell execution via Caldera/Atomic Red Team on DC01, verify full pipeline: Sysmon → Wazuh → TheHive
3 — HIGH	**First Greenbone scan**	Configure scan target 10.10.30.0/24, run Full and Fast scan, review Windows host findings
4 — HIGH	**T480 red node**	Connect T480 to Cisco switch, configure Proxmox, deploy Kali Purple on VLAN 50
5 — MEDIUM	**Remove TEMP firewall rule**	Remove TEMP-GREENBONE-INSTALL rule from SECURITY interface
6 — MEDIUM	**win-server01**	Deploy Windows Server 2022 member server VM 109 with IIS/MSSQL/SMB on VLAN 30
7 — LOW	**Velociraptor hunts**	Create first hunt: collect running processes and network connections from all 3 Windows hosts
